

ABSTRACT OF THE DISCLOSURE

5 An MPEG on-screen display coder includes a buffer,
an MPEG encoder, and a multiplexer. The buffer receives and
buffers an MPEG transport data stream containing frames of a
selected program and frames of a non-selected program. The
MPEG encoder encodes frames of the selected program with an
on-screen display. The multiplexer selectively passes to a
digital television receiver the frames of the non-selected
program, the encoded frames of the selected program, and
original frames of the selected program.
